Summary

Mid-level Backend Engineer with 4+ years of experience in capital markets fintech, payment security, and blockchain systems. Currently building microservices at WallStreetDocs that process thousands of SEC EDGAR filings monthly for J.P. Morgan, Citi, and Barclays. Previously designed HSM/KMS cryptographic infrastructure powering payment platforms serving millions of banking customers. Core strengths in Java/Spring Boot, distributed systems, CI/CD automation, and security engineering.

Work Rights: Eligible for Partner of a Student Work Visa (open work rights, no employer sponsorship required). Relocating to New Zealand in June 2026

IELTS: 7.0 Overall (L: 8.0 | R: 7.0 | S: 7.0 | W: 6.5)

Experience

Wall Street Docs (WSD)

Remote

Software Engineer L3

December, 2024 - Present

Global SaaS fintech serving tier-1 investment banks (J.P. Morgan, Citi, UBS, HSBC) with document automation and workflow solutions for the \$3T structured products market. Backed by Bowmark Capital (UK PE firm).

- Architected and delivered two core Spring Boot microservices for the SEC EDGAR filing system — Filing Disseminator (built from scratch with rate-controlled scheduling and throttling) and Filing Hub (central API controller managing filing lifecycle and status) — now processing thousands of regulatory filings monthly for J.P. Morgan, Bank of America, Citi, and Barclays.

- Enhanced CI/CD pipeline and deployment workflows, reducing release friction and enabling reliable continuous delivery across the filing platform.

- Reduced multi-VM deployment time from manual multi-step processes to one-click rollout by authoring Ansible automation scripts with environment-specific configurations, integrated into Jenkins pipelines — serving legacy structured product applications for UBS, HSBC, ZKB, and DZ Bank.

- Migrated multiple legacy Java/Spring applications to modern Spring Boot services, improving maintainability, testability, and scalability for European investment bank clients.

Kona Software Lab

Dhaka, Bangladesh

Software Engineer

Dec 2023 - Dec 2024

R&D-focused software firm specializing in payment security, blockchain, and cryptographic infrastructure for banking and fintech clients across South Korea and Bangladesh.

- Migrated the company's internal Java library from legacy Spring to Spring Boot 3.1 using a TDD approach as a core R&D team member, improving test coverage and developer productivity.

- Designed and implemented a Key Management Service (KMS) with Hardware Security Module (HSM) integration across Windows, RHEL, and Arch Linux — supporting key import/export, encryption, decryption, digital signing, and certificate generation. Now serving as the core vault component of a payment application used by millions of customers at Dutch-Bangla Bank (DBBL), Mercantile Bank (MBL), and Nagad.

- Built an OAuth 2.0 Authorization Server with client-credential flow to secure inter-service communication across internal microservices, ensuring zero-trust authentication between system components.

Graduate Engineer

Jun 2022 - Dec 2023

- Developed Solidity smart contracts enabling Ethereum batch transfers for a crypto trading platform built with Spring Boot, optimizing gas costs for high-volume transactions.

- Built a Blockchain Explorer backend using Go and Gin framework to track transactions, wallets, coin statistics, and user activity across blockchain projects.
- Contributed to a stablecoin payment system integrated with Kona Card (one of South Korea's largest payment schemes), announced at a major investor relations event in Seoul — currently in launch phase.

Education

Bangladesh University of Engineering and Technology (BUET)
Computer Science & Engineering

Bachelor Of Science

Dhaka, Bangladesh • Feb 2017 - May 2022
